

Remainder

A supplier-credit desk for independent food businesses.

Created by Shivam Gupta with AI-assisted engineering

THE MOMENT THAT MATTERS

A cafe reports a short delivery. A credit note arrives days later.
It covers the oat drink. The missing tomatoes still need a credit.

\$216

Reviewed claim

\$144

Credit note verified

\$72

Still outstanding

Fictional USD example. A verified credit note does not establish cash received or a credit applied to a bill.

THE PRODUCT

Bring invoice and receiving evidence into one case. Review AI-proposed findings with source quotations. Export the claim and evidence PDF. Match a later credit note and keep the remainder open.

THE FIRST CUSTOMERS

Independent cafes and hospitality bookkeepers. Begin with recent, redacted cases and measure review time, corrections, repeat use, and paid commitments.

THE AI BOUNDARY

Gemini passed two live synthetic cases. Optional Evorozen memory stores signed, reviewed aliases; its production module passed a live round-trip. Code validates evidence and money. Sponsor inference was unavailable during testing.

THE BUSINESS HYPOTHESIS

\$29 per location per month for 100 claim packs with a defined request budget. A guided trial comes first. Provider cost and support time determine a viable allowance.

Live preview on Render + Neon PostgreSQL. Integration checks use synthetic data, not customers or cash recovery. Evorozen offers the first 50 calls free: a finite allowance shared across any sponsor inference and memory requests.

Evidence: docs/validation-ai.md and docs/research.md
